Background: Increasing evidence has revealed that the aberrant expression of microRNAs (miRNAs) plays vital roles in the development and progression of ovarian cancer. MiR-200a-3p was found to act as an oncogene in a variety of cancers, however, the expression and function of miR-200a-3p in ovarian cancer has not been characterized.

Materials and methods: The expression of miR-200a-3p in ovarian cancer tissues and cell lines was detected by the RT-qPCR. The influence of miR-200a-3p on the growth of ovarian cancer cells was determined with the Cell Counting Kit-8 assay, colony formation and cell invasion assay. The binding of miR-200a-3p with the 3'-untranslated region (UTR) of PCDH9 was detected by luciferase reporter assay. The expression of PCDH9 was investigated by RT-qPCR and Western blot analysis.

Results: miR-200a-3p was up-regulated in ovarian cancer tissues and cell lines. Highly expressed miR-200a-3p was significantly associated with the tumor size, tumor metastasis and TNM stage. Overexpression of miR-200a-3p markedly promoted the proliferation, colony formation and invasion of ovarian cancer cells. Functional study uncovered that miR-200a-3p bound the 3'-untranslated region (UTR) of PCDH9 and decreased the expression of PCDH9 in ovarian cancer cells. The expression of miR-200a-3p in ovarian cancer tissues was significantly negatively correlated with that of PCDH9. Restored PCDH9 inhibited the promoting effect of miR-200a-3p on the proliferation of ovarian cancer cells.

Conclusion: Our results suggested the potential oncogenic function of miR-200a-3p via modulating PCDH9 in ovarian cancer.

Keywords: miR-200a-3p, ovarian cancer, PCDH9

Introduction

Ovarian cancer (OC) is the most lethal malignant gynecological cancer with the majority of patients diagnosed at the advanced stage.¹⁻³ Despite the remarkable progress in the treatment of OC including surgical resection, chemotherapy and radiotherapy, the 5-year overall survival rate of the OC patients remains less than 40%.⁴ OC has a high recurrence rate and tends to develop the resistance to the current therapy strategies. Therefore, it is vital to explore the molecular mechanisms involved in the progression of OC and identify novel targets with prognostic and therapeutic significance.

MicroRNAs (miRNAs) are a class of single stranded non-coding RNAs that down-regulate the expression of target genes via binding the 3'-untranslated regions (3'-UTR).^{5,6} The binding of miRNA results in the degradation or translation inhibition of targeted mRNAs.^{7,8} Dysfunction of miRNAs is frequently associated with a variety of biological processes, including cell proliferation, differentiation and

apoptosis.⁹ Recent studies demonstrated that the dysregulation of miRNAs significantly contributes to the development and progression of ovarian cancer.^{10–12} For example, Zhou et al found that miR-183 modulated the proliferation and apoptosis of ovarian cancer cells via targeting the TGF- β /Smad4 pathway.¹³ Overexpression of miR-598 inhibited the growth and metastasis of ovarian cancer cells by regulating the expression of URI.¹⁴ MiR-34c targeted SOX9 and regulated the sensitivity of ovarian cancer cells to cisplatin-based chemotherapy.¹⁵ Interestingly, the potential oncogenic function of miR-200a-3p in cancers was recently reported, which indicated the prognosis and therapeutic importance of miR-200a-3p in cancer.^{16–18} However, the role of miR-200a-3p in ovarian cancer remains largely unknown.

The cadherin superfamily is a large group of transmembrane or membrane-associated glycoprotein, which plays important roles in the embryogenesis and maintaining the normal tissue structure.^{19,20} Some cadherins, such as E-cadherin, were reported as tumor suppressor genes (TSG) in the invasion and metastasis of cancer cells.²⁰ The protocadherins (PCDHs) belonging to the cadherin superfamily are a group of calcium-dependent adhesion proteins.^{21,22} Recent studies showed that PCDH8, PCDH10 and PCDH17 acted as tumor suppressors in a variety of human cancers.^{23–34} PCDH9 is another member of the PCDH family located in the 13q21.32 of human genome. Previous studies demonstrated that PCDH9 was down-regulated in cancers, such as glioblastoma, hepatocellular carcinoma and gastric cancer.^{35–38} Overexpression of PCDH9 inhibited the proliferation, migration and invasion of cancer cells. However, the function of PCDH9 in ovarian cancer remains largely unknown.

The aim of this study was to explore the role of miR-200a-3p in the progression of ovarian cancer. It was observed that miR-200a-3p was up-regulated in ovarian cancer tissues and cell lines. Functional studies uncovered that miR-200a-3p inhibited the proliferation of ovarian cancer cells via targeting PCDH9. These findings revealed the functional mechanism of miR-200a-3p in regulating the growth of ovarian cancer cells and shed light on the clinical significance of miR-200a-3p/PCDH9 axis in ovarian cancer.

Materials and methods

Tissue samples

A total of fifty paired ovarian cancer tissues and adjacent normal tissues (at least 5 cm from primary tumor margin)

were obtained from the ovarian cancer patients via surgical resection at The Affiliated Huai'an No. 1 People's Hospital of Nanjing Medical University from August 2010 to December 2013. The tissues were immediately frozen in liquid nitrogen and stored at -80°C prior to the experiments. Written informed consents were obtained from all the patients. This study was approved by the Ethics Committee of The Affiliated Huai'an No. 1 People's Hospital of Nanjing Medical University.

Cell culture and transfection

Ovarian cancer cell lines including ES2, HO8919PM, SKOV3, HO8910 and the ovarian surface epithelial cells HOSEpiC were purchased from the Chinese Academy of Sciences (Shanghai, China). HO8919PM and HO8910 cells were cultured in RPMI1640 medium containing 10% fetal bovine serum (FBS, Corning, NY, USA) and 1% streptomycin/penicillin at 37°C with 5% CO_2 . SKOV3 and ES2 were cultured with the McCoy's 5A modified medium supplemented with 10% FBS. The cell transfection was performed with the Lipofectamine 2000 (Invitrogen) according to the manufacturer's instructions.

RNA extraction and quantitative PCR

Total RNA was extracted from tissues or cell lines using the Trizol reagent (Invitrogen) according to the manufacturer's protocol. The isolated RNA was reverse transcribed into cDNA using the Revert Aid First Stand cDNA synthesis kit (Thermo Fishers Inc., USA) with random primers. The expression of miR-200a-3p was determined by quantitative real-time PCR with the SYBR master mix (Takara, Dalian, China) in according with the manufacturer's instructions. The experiment was performed in triplicate and the expression of U6 RNA was detected as the internal control. The relative expression of miR-200a-3p was calculated with the $2^{-\Delta\Delta\text{Cq}}$ method. The primers used in this study were designed as follows: miR-200a-3p forward: 5'-TAACACTGTCTGGTAACGATGT and reverse: 5'-CATCTTACCGGACAGTGCTGGA; U6 forward: 5'-CTCGCTTCGGCAGCACA and reverse: 5'-AACGCTTCACGAATTTGCGT. The primers were synthesized in Sangon Biotech Inc. (Shanghai, China).

Cell proliferation assay

The proliferation of ovarian cancer cells transfected with miR-200a-3p mimics or scramble control miRNA was determined by the Cell Counting Kit-8 (CCK-8) assay according to the instructions of the manufacturer. Briefly,

cells were plated in 96-well plates and transfected with the corresponding miRNA with the Lipofectamine 2000. The proliferation of ovarian cancer cells was detected at the 72 h after transfection. 10 μ L of CCK-8 solution was added into the medium and incubated for additional 3 h at 37 °C. Absorbance of the medium at 450 nm was measured using the microplate reader (Bio-Rad Laboratories, Richmond, CA, USA).

Western blot

Ovarian cancer cells were transfected with miR-200a-3p mimics or scramble control miRNA using Lipofectamine 2000 for 48 h. Cells were harvested and lysed with the NP-40 lysis buffer (Beyotime, Shanghai, China) on ice for 10 min. The protein was extracted by centrifugation at 12,000 rpm for 5 min at 4 °C. Protein concentration was determined using the BCA assay kit (Beyotime, Shanghai, China) according to the manufacturer's instructions. Equal amount of protein was separated by SDS-PAGE and then transferred onto the nitrocellular membrane (Millipore, MA, USA). The membrane was subsequently blocked with 5% non-fat milk for 1 h at room temperature (RT) followed by incubated with the primary antibody overnight at 4 °C. After washing twice with TBST, the membrane was incubated with HRP-conjugated secondary antibody for 1 h at RT. The protein bands were visualized using enhanced ECL reagents (Millipore, MA, USA). The antibodies using in this study including anti-PCDH9 (#25090-1-AP; Proteintech, Rosemont, IL, USA) and anti-GAPDH (#10494-1-AP; Proteintech, Rosemont, IL, USA) were purchased from the biology companies.

Dual luciferase reporter assay

The wild-type or mutated 3'-UTR of PCDH9 was amplified and inserted into the pmir-GLO-promoter vector (Promega, Madison, WI, USA). Ovarian cancer cells transfected with miR-200a-3p mimics or scramble control miRNA were co-transfected with the luciferase reporter vector containing wild-type or mutated 3'-UTR of PCDH9. After transfection for 48 h, cells were collected and the luciferase activity was determined using the Dual Luciferase Assay Kit (Promega, Madison, WI, USA) in accordance with the manufacturer's instructions.

Statistical analysis

Data was present as mean \pm s.d. Statistical analysis was performed using the GraphPad 7.0 (GraphPad Software Inc., LaJolla, CA, USA). The difference between two

groups was analyzed with the Student's *t*-test. One-way ANOVA analysis was performed to calculate the *P*-value between more than two groups. *P*<0.05 was considered as statistically significant.

Results

MiR-200a-3p was up-regulated in ovarian cancer tissues and cell lines

To explore the potential involvement of miR-200a-3p in ovarian cancer, the expression of miR-200a-3p in 50 paired ovarian cancer tissues and adjacent normal tissues was analyzed with the RT-qPCR. Compared with the normal tissues, the expression of miR-200a-3p was significantly up-regulated in ovarian cancer tissues (Figure 1A). Moreover, miR-200a-3p expression in ovarian cancer cell lines including ES2, HO8919PM, SKOV3 and HO8910 was also decreased in comparison with that of the normal ovarian surface epithelial cells HOSEpiC (Figure 1B). To better determine the clinical significance of miR-200a-3p in ovarian cancer, all the ovarian cancer patients were divided into low- and high miR-200a-3p group with the median expression level of miR-200a-3p as the cutoff value. The correlation between the expression of miR-200a-3p with the clinical characteristics was analyzed. As shown in Table 1, high level of miR-200a-3p was significantly associated with the tumor size, tumor metastasis and TNM stage. The expression level of miR-200-3p in ovarian cancer patients was included in Table S1. These results suggested that miR-200a-3p might be involved in the progression of ovarian cancer.

Overexpression of miR-200a-3p promoted the growth of ovarian cancer cells

To understand the regulation of miR-200a-3p on the growth of ovarian cancer cells, both ES2 and SKOV-3 were transfected with miR-200a-3p mimics or scramble control miRNA. The transfection efficiency was confirmed using RT-qPCR as shown in Figure 2A. The effect of miR-200a-3p on the growth of ovarian cancer cells was evaluated with the CCK-8 assay, colony formation, cell cycle analysis and cell invasion. As presented in Figure 2B, overexpression of miR-200a-3p significantly promoted the proliferation of both ES2 and SKOV3 cells. The colony formation assay showed that the number of colonies formed with the ovarian cancer cells transfected with miR-200a-3p was up-regulated compared with that of the ovarian cancer expressing scramble control miRNA (Figure 2C). The promoting effect of miR-200a-3p on the proliferation of ovarian cancer cells was also

demonstrated by the finding that overexpression of miR-200a-3p triggered the cell cycle progression from G1 to S phase (Figure 2D). Furthermore, as indicated in Figure 2E, up-regulated miR-200a-3p significantly promoted the invasion of both ES2 and SKOV-3 cells (Figure 2E). Collectively, these results uncovered that overexpressed miR-200a-3p promoted the growth and invasion of ovarian cancer cells.

MiR-200a-3p bound the 3'-UTR of PCDH9 and negatively regulated the expression of PCDH9

To further investigate the underlying molecular mechanism by which miR-200a-3p modulated the proliferation of ovarian cancer cells, the potential targets were predicted using the miRDB. The result showed that the 3'-UTR of PCDH9

contained the putative seeding sequence of miR-200a-3p (Figure 3A). The important function of PCDH9 in the development of cancers has been demonstrated by previous studies.^{36,39} However, the involvement of PCDH9 in ovarian cancer remains largely unknown. To validate this prediction, luciferase reporter assay was performed by transfecting both ES2 and SKOV3 with miR-200a-3p mimics/Scramble control miRNA and the wild-type/mutated PCDH9. The data showed that miR-200a-3p overexpression significantly repressed the luciferase activity of ovarian cancer cells harboring wild-type 3'-UTR of PCDH9 (Figure 3B and C). However, the inhibitory effects was almost completely abolished in ovarian cancer cells transfected with mutated 3'-UTR (Figure 3B and C). These results indicated the binding between miR-200a-3p with the 3'-UTR of PCDH9. To confirm whether the binding affected the expression of PCDH9, both the mRNA and

protein levels of PCDH9 with the transfection of miR-200a-3p were detected. As indicated in [Figure 3D](#), overexpression of miR-200a-3p significantly suppressed the mRNA level of PCDH9 in both ES2 and SKOV3 cells. Consistently, the protein abundance of PCDH9 was also dramatically decreased with the overexpression of miR-200a-3p in ovarian cancer cells ([Figure 3E](#)). To further validate the negative modulation of miR-200a-3p on the expression of PCDH9, both ES2 and SKOV3 cells were transfected with miR-200a-3p antagomir to knockdown the expression of miR-200a-3p ([Figure 3F](#)). As shown in [Figure 3G](#) and [H](#), both the mRNA and protein levels of PCDH9 were significantly increased with the knockdown of miR-200a-3p in ovarian cancer cells. These results

suggested PCDH9 as a target of miR-200a-3p in ovarian cancer cells.

The promoting impact of miR-200a-3p on the proliferation of ovarian cancer cells was neutralized by overexpressed PCDH9

To explore whether miR-200a-3p promoted the growth of ovarian cancer cells via regulating PCDH9, both ES2 and SKOV3 cells were co-transfected with the pcDNA-Flag-PCDH9 and miR-200a-3p mimics. The overexpression of PCDH9 was detected by Western blot using anti-Flag

antibody (Figure 4A). CCK-8 assay indicated that transfection of PCDH9 significantly attenuated the promoting effect of miR-200a-3p on the proliferation of both ES2 and SKOV3 cells compared with the cells transfected with miR-200a-3p alone (Figure 4B). Consistently, the colony formation of both ES2 and SKOV3 cells was also inhibited with the co-transfection of PCDH9 compared with the control group (Figure 4C). Meanwhile, restoration of PCDH9 also attenuated the promoting effects of miR-200a-3p on the

invasion of ovarian cancer cells (Figure 4D). These results suggested the critical role of PCDH9 in mediating the oncogenic function of miR-200a-3p in ovarian cancer cells.

To further support the relationship between miR-200a-3p and PCDH9, the expression of PCDH9 in ovarian cancer tissues was detected. As presented in Figure 4E, PCDH9 expression was significantly down-regulated in ovarian cancer tissues in comparison with that of the corresponding normal tissues. The decreased level of PCDH9 was also

observed in a serial of ovarian cancer cells compared with the normal cells (Figure 4F). To characterize the correlation between the expressions of miR-200a-3p and PCDH9, spearman test was performed. The analysis indicated the

significant negative correlation between the level of miR-200a-3p and PCDH9 (Figure 4G). These results further supported the negative regulation of miR-200a-3p on the expression of PCDH9 in ovarian cancer cells.

Discussion

An increasing body of evidence has indicated the important function of miRNAs in ovarian cancer. MiR-200a-3p was overexpressed and played oncogenic roles in a variety of cancers.^{17,18} Recent study showed that miR-200a-3p increased the 5-fluorouracil resistance of hepatocellular carcinoma cells by regulating the dual specificity phosphatase 6 expression.¹⁷ The oncogenic role of miR-200a-3p was also established in esophageal cancer by post-transcriptionally modulating the expression of cytoplasmic collapsing response mediator protein-1.¹⁸ MiR-200a-3p promoted the cell survival after 5-fluorouracil treatment in human hepatocellular carcinoma.¹⁷ Interestingly, it was also reported that miR-200a-3p regulated the expression of SPAG9 and inhibited the proliferation of renal cell carcinoma.⁴⁰ Recent study also demonstrated that miR-200 family members suppressed the epithelial-mesenchymal transition of lung cancer.⁴¹ The tumor suppressive role of miR-200 family is closely associated with the glioma initiation, progression and metastasis.⁴² These findings suggested the opposite function of miR-200a-3p and other miR-200 family members in cancers. In the present study, we found that miR-200a-3p was significantly up-regulated in ovarian cancer tissues and cell lines. Overexpressed miR-200a-3p was remarkably associated with the advanced progression of ovarian cancer patients. These results suggested that miR-200a-3p was possibly involved in the pathogenesis of ovarian cancer and was a promising biomarker for the prognosis of ovarian cancer.

The potential oncogenic role of miR-200a-3p in ovarian cancer was further evaluated by in vitro functional experiments. Overexpression of miR-200a-3p significantly promoted the proliferation and colony formation of ovarian cancer cells. Moreover, highly expressed miR-200a-3p enhanced the cell cycle progression and the invasion of ovarian cancer cells. Considering the promoting impact of miR-200a-3p in regulating the malignant behaviors of ovarian cancer cells, it might be necessary to determine the effect of miR-200a-3p on the resistance of ovarian cancer cells to chemotherapy and radiotherapy. Additionally, the potential oncogenic role of miR-200a-3p in ovarian cancer calls for further in vivo validation.

PCDH9 is a member of the protocadherin family and cadherin superfamily.³⁷ Recent studies identified PCDH9 as a potential tumor suppressor in a variety of cancers. Down-regulation of PCDH9 was associated with the poor prognosis and worse survival rate of cancer patients.³⁶ It is

well established that aberrant miRNA profiles regulated the malignant phenotypes through regulating the expression of target genes. PCDH9 was identified as the downstream target of miR-215-5p in gliomas and inhibited the growth of glioma cells.³⁵ In this study, the possible binding sites of miR-200a-3p at the 3'-UTR of PCDH9 was predicted with the miRDB. Functional analysis showed that miR-200a-3p bound the 3'-UTR of PCDH9 and suppressed the expression of PCDH9 in ovarian cancer cells. Significant inverted correlation between the expression of miR-200a-3p and PCDH9 was observed in ovarian cancer tissues. Restored PCDH9 significantly reversed the promoting effect of miR-200a-3p on the proliferation of ovarian cancer cells. These results demonstrated the essential role of PCDH9 in mediating the potential oncogenic function of miR-200a-3p in ovarian cancer. As miRNAs have multiple targets, the involvement of other targets in addition to PCDH9 requires further investigation.

In conclusions, our findings demonstrated that miR-200a-3p was up-regulated in ovarian cancer and significantly associated with the advanced progression of ovarian cancer patients. Overexpressed miR-200a-3p promoted the proliferation of ovarian cancer cells via targeting PCDH9. Our results provided the novel functional mechanism of miR-200a-3p/PCDH9 axis in ovarian cancer. Targeting miR-200a-3p might be a promising strategy for the treatment of ovarian cancer.

OncoTargets and Therapy

Dovepress

Publish your work in this journal

OncoTargets and Therapy is an international, peer-reviewed, open access journal focusing on the pathological basis of all cancers, potential targets for therapy and treatment protocols employed to improve the management of cancer patients. The journal also focuses on the impact of management programs and new therapeutic

agents and protocols on patient perspectives such as quality of life, adherence and satisfaction. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
