

Influencing behavioral change by customer engagement amongst youth

Abstract: It is widely accepted that many social and health problems have underlying behavioral causes. Because these problems are rooted in human behavior, solutions to deal with them also lie in human behavior. This paper examines ways of integrating customer engagement in social programs to influence and initiate behavior change effectively with a special focus on youth. This work followed a theoretical deduction by use of a literature review. Social marketing places emphasis on behavior change, and one of the key challenges for social marketers is to ensure a perceived value for customers in taking up and maintaining positive behavior. If perceptions, beliefs, attitudes, and values influence behavior, then the central focus should be on the youth. Integrating youth is a prerequisite for effective social marketing programs and ultimately behavioral change. This approach will pave the way for effective brand positioning and brand loyalty in social marketing which has been lacking and requires more attention from researchers and policymakers. This paper outlines theoretical developments in social marketing that will increase the effectiveness of social marketing programs overall. Existing social marketing literature typically focuses on social marketing interventions and behavioral change. This paper uses customer engagement within a social marketing context so that social marketing programs are perceived as brands to which youth can relate.

Keywords: social marketing, customer engagement, behavioral influence, change, youth

Introduction

Youth often make decisions and choices which are detrimental to their health and to society at large. Policymakers, along with commercial and noncommercial organizations, use social marketing to address health and social problems, especially in areas where educational and legal interventions have failed.¹ Because social marketing focuses on influencing behavioral change, there has been a dramatic increase in its application.² Social marketing has been used to deal with obesity, tobacco prevention and cessation, family planning, promoting safe sex, waste management, and environment management.³⁻⁵

Andreasen⁶ discussed the origins of social marketing extensively, and the transformations and challenges the domain has faced. In suggesting how the discipline could develop further, he highlights two key challenges, ie, identifying potential triggers between contemplation and action, and maintenance of behavior. A review of social marketing effectiveness based on 54 interventions⁷ found evidence that interventions developed on the basis of social marketing criteria⁴ can be effective. However, that review noted that interventions to prevent youth smoking and alcohol and illicit drug

use had significant positive effects in the short term but that these effects were not consistent in the medium to long term, as shown in Figure 1.

Why is it difficult to achieve long-term behavioral change? Why is it difficult to convert intentions into actual behaviors? Because the premise of social marketing is based on applying commercial marketing techniques, this paper examines the current trend in commercial marketing, ie, customer engagement, and assesses its applicability in social marketing. Suggestions for future directions in this discipline with a theoretical customer engagement framework are proposed in an attempt to engage customers for initial and sustainable behavioral change. As discussed in this paper, customer engagement sheds light on the “black box” that exists between intentions and behavior.

Behavior change through social marketing

There are three common approaches to behavior change, ie, education, marketing, and legislation.⁸ Education focuses on raising awareness but does not offer rewards or punishment, marketing attempts to influence behavior by offering incentives and/or disincentives in an environment of voluntary exchange, and legislation uses coercion to influence behavior. Because marketing offers an incentive and is voluntary, it has the ability to influence behavior effectively in the long term.

In 1951, when Wiebe⁹ asked “Can brotherhood be sold like soap?” he paved the way for researchers and practitioners to adapt commercial marketing tools to solve health and social problems. The principles and practices of social marketing

are being successfully applied to many health programs.¹⁰ The definition proposed by Kotler and Zaltman¹¹ focused more on ideas than on attitudes and behavior. Bartels¹² shifted the focus from “economic” behavior to “social” behavior to broaden the scope of marketing. Andreasen identified social marketing as the application of marketing techniques to influence human behavior in a manner that is beneficial to the community, and proposed the following definition of social marketing: “The application of commercial marketing technologies to the analysis, planning, execution and evaluation of programs designed to influence the voluntary behavior of target audiences in order to improve their personal welfare and that of society.”¹³

This definition emphasizes that the core of social marketing is to promote behavioral change. The key dimensions to this are exchange, commercial marketing strategies, and voluntary change. MacFadyen et al¹⁴ perceived social marketing as having an influence on individual behavior, and further suggested that it could be used to change the behavior of groups and organizations and to target broader environmental influences on behavior. The National Social Marketing Centre¹⁵ defines social marketing as “the systematic application of marketing alongside other concepts and techniques to achieve specific behavioral goals, for social or public good”. With the growing debate over definitions in social marketing, Andreasen⁴ called for social marketers to focus more on designing effective social marketing programs. He developed the following six benchmarks by which a social marketing program can be developed and assessed: use of behavioral change is the benchmark; consistent use of

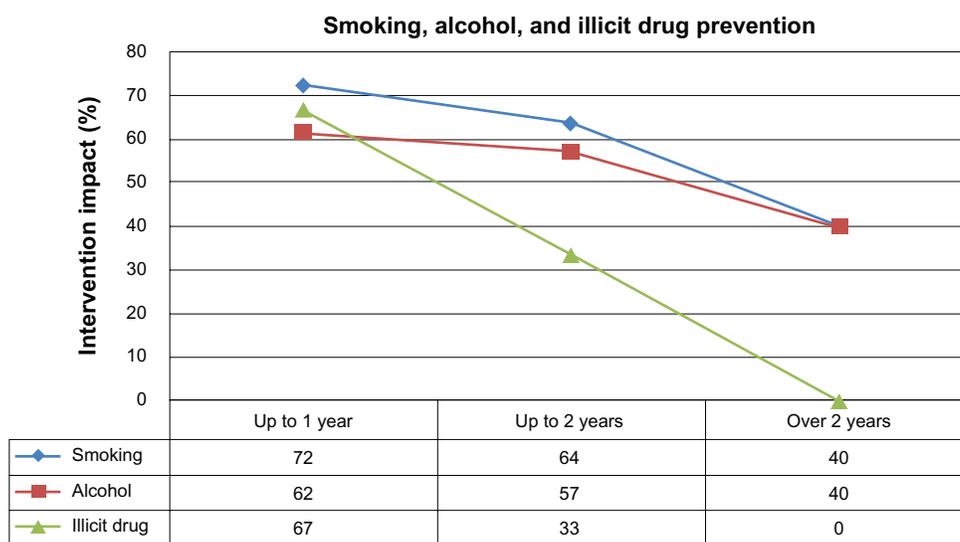

Figure 1 Effectiveness of social marketing interventions. Adapted from data presented in Stead et al.⁷

audience research when developing, testing, and monitoring an intervention; careful segmentation of the target audience; clear motivation that influences the target audience to change or modify behavior; use of the traditional four “Ps” in the social marketing strategy; and awareness of competitor products that might impede the desired behavior.

The key purpose of social marketing is to benefit individuals, who are the target of any campaign, not the organizations responsible for the campaign. Social marketing focuses on the target audience, which has a primary role in the process.¹⁶ The planning process in social marketing takes this consumer focus into account by addressing the elements of the marketing mix. The “marketing mix”, ie, the four “Ps” first described by McCarthy in 1960 as “product, price, place and promotion”,¹⁷ demands that managers make choices concerning the type and number of products to produce, the number and type of distribution channels for those products, and the positioning of the products with respect to substitutes and similar offerings from competitors.¹⁸

These four Ps are often used in social marketing, such as demarketing of tobacco to discourage its use. Kotler and Levy define demarketing as “that aspect of marketing that deals with discouraging customers in general or a certain class of customers in particular on either a temporary or permanent basis”.¹⁹ In the social marketing context, the aim of demarketing is to deflate demand by discouraging consumption or use of products that pose a serious health risk.²⁰ This is implemented using various demarketing strategies formulated around the four “Ps”, such as tobacco price increases,²¹ advertising bans,²² and smoking bans.²³ Successful marketing programs use a differentiated marketing mix to target specific segments of the general population. The emphasis lies in the target markets being attractive due to their uniqueness and likelihood of purchasing a particular product. A distinction between the traditional four “Ps” of marketing and the four “Ps” of demarketing was made by Shiu et al.²⁴ To assess the implications of social marketing strategies, it is crucial to examine the behavior of consumers carefully.

Theory of reasoned action

In an attempt to articulate a “cumulative body of knowledge in the attitude area”²⁵ that would provide a clear distinction between beliefs, attitudes, intentions, and behaviors, Fishbein and Ajzen developed the theory of reasoned action, which has been used by many researchers to predict an individual’s intentions or behavior,²⁶ but it does have limitations.²⁷ The main criticism of the theory of reasoned action is that it fails to account for behaviors associated with incomplete volitional control.²⁸

Theory of planned behavior

The theory of planned behavior put forward by Ajzen²⁹ is an extension of Fishbein and Ajzen’s theory of reasoned action. The central construct of this theory is still intention, with the inclusion of “perceived behavioral control” as a further construct. Burton³⁰ points out that, with the inclusion of the perceived behavioral control construct, this model enables measurement of the extent to which an individual believes the outcomes of behavior can be controlled. The theory of planned behavior suggests the use of attitudes, subjective norms, and perceived behavioral control to understand beliefs and thus predict behavior.

Health belief model

Developed in the 1950s, the health belief model suggests that health behavior is a function of individual sociodemographic characteristics, knowledge, and attitudes.³¹ The limitation of the health belief model is that it does not focus on factors enabling and reinforcing human behavior, and these factors become increasingly important when the model is used to explain and predict more complex lifestyle behaviors that need to be maintained over a lifetime, just like the theory of reasoned action, the theory of planned behavior, and the “precede-proceed model”.³² Nevertheless, the health belief model has been used widely in the public health literature, almost replacing the transtheoretical model of stages of change developed by Prochaska and Velicer,³³ focusing on the stages of: precontemplation, ie, no intention to take action within the next 6 months; contemplation, ie, intention to take action within the next 6 months; preparation, ie, intention to take action within the next 30 days and some behavioral steps have been taken; action, ie, overt behavior has been changed for less than 6 months; and maintenance, ie, overt behavior has been changed for more than 6 months.

Social cognitive theory

The social cognitive (learning) theory states that new behaviors are learned either by modeling the behavior of others or by direct experience. Social learning theory looks at human behavior as a continuous interaction between cognitive, behavioral, and environmental determinants.³⁴ Successful implementation of intervention strategies needs enlistment of the help of these subgroups and to modify the norms of this network to support positive changes in behavior.³⁵

Diffusion of innovation theory

Rogers³⁶ describes the diffusion of power theory as the process by which an idea is disseminated throughout a community.

This theory has four essential elements, ie, innovation of an idea or concept; communication of the idea to a target audience; use of a social system to implement the idea; and allowing ample time for the idea to be cemented in the long term. The community needs to be exposed to a new idea, which takes place within a social network or through the media, and this will determine the rate at which people adopt a new behavior over time.³⁷ When beneficial beliefs for prevention are instilled and widely held within an individual's immediate social network, behavior is more likely to be consistent with perceived social norms.³⁸ Both the social influence model³⁹ and social network theory⁴⁰ suggest that social behavior should be understood not as an individual phenomenon but rather in the context of relationships, with a network of people that act as a reference group and sanction behavior, and that this is key to understanding individual risk-taking behavior.⁴¹ In other words, social norms are best understood at the level of social networks. Social theories and models see individual behaviors as embedded in the social and cultural context of the target audience. Levy and Zaltman⁴² identified three levels in society at which social change might occur, ie, the micro level (individual), the group level (organization), and the macro level (society).

This review of social marketing and theories about behavioral change highlights that social marketing has emphasized both implicitly and explicitly a need for relationships. In relationship marketing, Morgan and Hunt⁴³ discussed this as a network paradigm, which was subsequently adapted by Hastings⁵ to include a relational approach to social marketing. Therefore, social marketing is a process that works upstream, downstream, and midstream in the context of a holistic system of relationships.¹⁵ Can a general theory of change effectively provide a framework for behavior change as societies and individuals evolve?

Post-modernism

Post-modern theorists, eg, Lyotard,⁴⁴ conceptualize modernity as an historical period in which, despite the world being understood as complex, perceptions were organized by totalizing theoretical systems focused on predictability, objectivity, and scientific progress. Post-modern knowledge is comprised of small and multiple narratives about a multiple world.⁴⁵ Therefore, the argument is that it is not possible to describe the world through scientific discourses unified around a meta-language. Post-modernists view today's world as fragmented, complex, and unpredictable. Venkatesh⁴⁶ discussed the characteristics of post-modernity, ie, disappearance of continuity, unity, purpose, and commitment, and the emergence of fragmentation and resistance.

Beck et al⁴⁷ disagree about the world being fragmented, observing that society will always form social cohesion in action. Individuals will change their values and social bonds according to their own perceptions about risks in a contemporary world, and individuals are capable of recognizing the social conditions of their existence. Goubman⁴⁸ identifies this as the triumph of formal rationality and a calculative approach towards the universe, and the alliance between science and technology is seen as the main tool for comprehension of the universe. This is the central process of transition from modernity to post-modernity. Kellner⁴⁹ suggests that we are in an interregnum between an aging modern and an emerging post-modern era. There are also claims that post-modernism has already occurred, equating it with an earthquake and we are now living with the aftershocks in a world that is forever changed.⁵⁰

This paper is based on the notion that we are in a stage of transition. Hence the notion of individuals having a fixed set of values will change to one of each individual creating their own personal and flexible hierarchy out of the values available in their social and cultural settings.⁵¹ Rokeach defines a set of values in this context as an "enduring belief that a specific mode of conduct or end-state of existence is personally or socially preferable to an opposite or converse mode of conduct or end-state of existence".⁵² Values influence an individual's behavior and, as values change, so does behavior.

Firat and Venkatesh⁵³ describe pastiche as an attitude expressed in the form of lack of emotional bonds and commitment by individuals. Schizophrenia is referred to as a lack of synchronicity between an individual's identity and their experiences, resulting in materialistic consumption. This creates a scenario where an individual's values are in conflict with societal values, which creates a dilemma for policymakers. The consequences of this conflict in values are discussed by Firat and Venkatesh,⁵³ who categorize post-modern culture as hyperreality, fragmentation, reversal of consumption and production, decentering of the subject, and paradoxical juxtaposition of opposites, all of which create a loss of commitment. The gap between societal and individual value systems poses challenges for individual identity.

Bellah et al argues that "We need to recognize that it is only in relation to society that the individual can fulfill himself and that if the break with society is too radical, life has no meaning at all".⁵⁴ Therefore, individuals can only achieve genuine recognition of individuality via others. Hence, despite differences in ideology, an individual still depends on society. This calls for pluralism, which is the acceptance of

differences.⁵⁵ Acceptance of differences creates an environment conducive to social order, which is interrelated with overall economic order. Sherry⁵⁶ identified this, and called for tolerance and recognition of differences. This can only be achieved by dialog and interaction.

Creation of value

The impact of postmodernism and its interplay with marketing has been discussed by previous researchers.^{53,57,58} Post-modernism is a call for marketing to deepen its paradigm and place an emphasis on consumers as individuals and not as segments. The discipline has been going through changes over the years from a transaction focus to a relational focus.⁵⁹ To address consumer attributions to value in the post-modern world, the customer is seen as the main driver of value creation.^{60,61} Traditional marketing has failed to place customers first,⁶² and relationship marketing is needed for the transformation towards genuine customer involvement to increase both the effectiveness and efficiency of marketing.^{63,64}

Relationship marketing

Gronroos⁶⁵ developed several new concepts in service marketing, which were later incorporated as part of the Nordic School of Services. The central focus was on relationship marketing. Relationship marketing has been viewed as buyer-seller encounters that accumulate over time, with opportunities to transform individual and discrete transactions into relational partnerships.⁶⁶ Tzokas and Saren defined relationship marketing as “the process of planning, developing and nurturing a relationship climate that will promote a dialogue between a firm and its customers which aims to imbue an understanding, confidence and respect of each others’ capabilities and concerns when enacting their role in the market place and in society”.⁶⁷ The concept of dialog has been captured by this definition of relationship marketing, which creates a perception about value and quality.

Quality perceived by consumers

Other researchers^{68,69} have discussed customer-perceived quality as a function of customer perception of two dimensions, ie, what the customer receives and the impact of various interactions the customer has with the marketing body. In the interaction process, these are known as technical quality and functional quality, respectively.⁷⁰ Technical quality is dominant in transaction marketing. Relationship marketing encompasses both quality dimensions in an attempt to provide customers with added value. Morgan and Hunt⁴³ emphasize

trust and commitment as being crucial to the relationship to add value for customers.

Trust

Discussions on trust have received a great deal of attention in organizational behavior studies,⁷¹ in social psychology,⁷² sociology,⁷³ and in economics.⁷⁴ Trust has been conceptualized as a willingness to rely on an exchange partner in whom one has confidence,⁷⁵ and according to Morgan and Hunt,⁴³ exists when one party has confidence in an exchange partner’s reliability and integrity. Furthermore, trust directly influences relationship commitment.⁴³

Commitment

Commitment is considered to be central to all relational exchanges between the various protagonists in commercial marketing.⁴³ Moorman et al define commitment as “an enduring desire to maintain a valued relationship”.⁷⁵ Morgan and Hunt’s⁴³ theory of trust and commitment can be expanded further by including satisfaction as a key concept.⁷⁶

Satisfaction

De Wulf and Odekerken-Schroder⁷⁶ define relationship satisfaction as a consumer’s affective state resulting from an overall appraisal of his or her relationship with the retailer. Satisfaction has become the mantra for corporate success.⁷⁷ In the academic literature, satisfaction has been conceptualized as a post-consumption cognitive process.^{78,79} Satisfaction alone does not measure the depth of consumer responses and reactions to consumption, and should not be relied on exclusively as a proxy for loyalty.⁸⁰ Bowden⁸¹ called further for a distinction between new and loyal customers. There is a need to focus beyond post-consumption and explore ways of integrating consumers in delivering value, which will influence attitude and behavior.

The drivers of relationship marketing are companies which, in the context of social marketing, are social marketing organizations. Patterson et al⁸² discuss multicomponent social marketing interventions, such as community, school, and family involvement, which have long-term effects, underscoring the importance of integrating all stakeholders. To achieve behavioral change, there is a need to focus on upstream and midstream stakeholders in social marketing. As conflict and disjointedness between societal and individual value systems continues, there is a need to integrate all protagonists in a relationship for the betterment of both society and the individual.

Relationship marketers offer customers value-adding benefits that are not readily available elsewhere, which creates a

strong foundation for maintaining and enhancing relationships. In the case of social marketing, the challenge is to portray the benefit of giving up socially undesirable behaviors, such as smoking, alcohol, and drug abuse, which often leads social marketers to resort to scare tactics, which can change a behavior temporarily, eg, fear-based antismoking advertisements, but long-term behavioral change requires commitment and loyalty. Achterberg et al,⁸³ in an empirical study, identified that type of involvement rather than advertising appeal increases brand loyalty. Because individuals project themselves through brand association, a social marketing intervention needs to create its own brand, not by scare tactics but by customer involvement.

Another issue is that commitment to the relationship is pivotal to social marketing, and consumer behavior change will not be sustainable without it. Because the post-modern consumer experiences distrust and loss of commitment, there is a challenge in relationship marketing to ensure trust and commitment is embedded between consumers and stakeholders. However, social marketing organizations are still drivers of trust and commitment.

How can customers be involved in social marketing programs so that satisfaction, trust, and commitment can lead to actual behaviors and not just intentions? The solution lies in customer engagement. This represents a dilemma, because the multirelationship model of social marketing described by Hastings⁵ places the focus once again on social marketing organizations rather than on customers. Addressing this gap,

this paper focuses on the central tenet of the multirelationship model of social marketing to consumers, as emphasized by Morgan and Hunt (see Figure 2).⁴³

Customer engagement

An examination of other such mechanisms led to a focus on the customer engagement concept, which may be a superior predictor of customer loyalty relative to traditionally used marketing constructs.^{84,85} The concept of engagement has its origins traced back to psychology and organizational behavior disciplines.^{86,87} In organizational behavior, the term “employee engagement” has been used as a means to explore and explain organizational commitment and citizenship behavior, and subsequently as a predictor of financial performance.⁸⁸

Engagement has been found to generate a number of potentially positive consequences at both the organizational and individual levels including attitudes, intentions, and behaviors, such as job satisfaction, low absenteeism, high organizational commitment, superior customer-related performance, and customer evaluations.⁸⁴⁻⁸⁸ In the marketing discipline, the concept is typically applied as “customer engagement”,^{84,85} reflecting the relevant individual and/or context-specific levels of engagement of customers with particular objects, such as brands,⁸⁸ products, or organizations.⁸⁵ Customer engagement is thus crucial to explaining and/or predicting customer experience, perceived value, and/or loyalty outcomes. Bowden defines customer engagement as “a psychological process that models

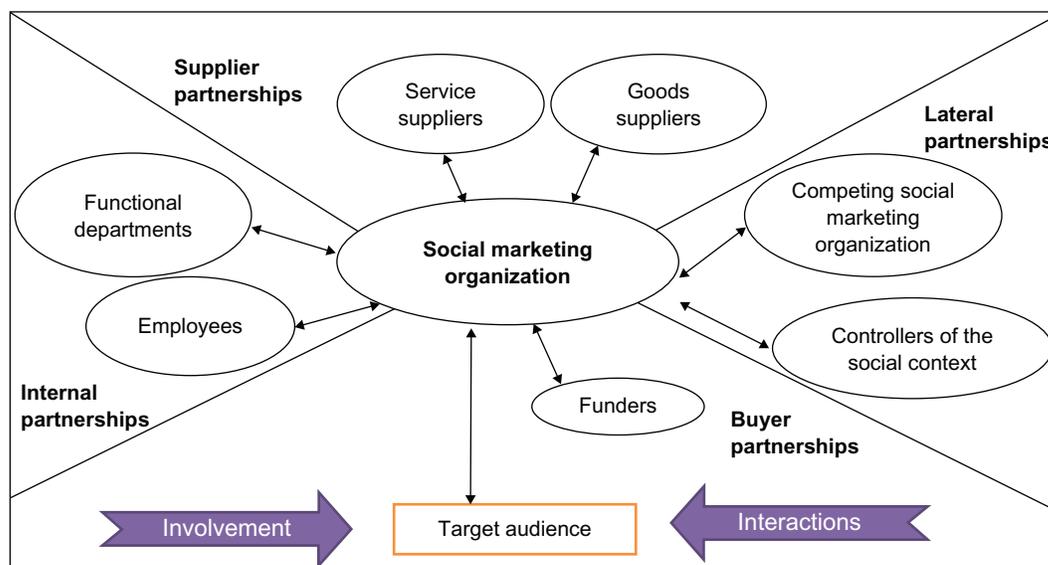

Figure 2 Multirelationship model of social marketing.⁴³

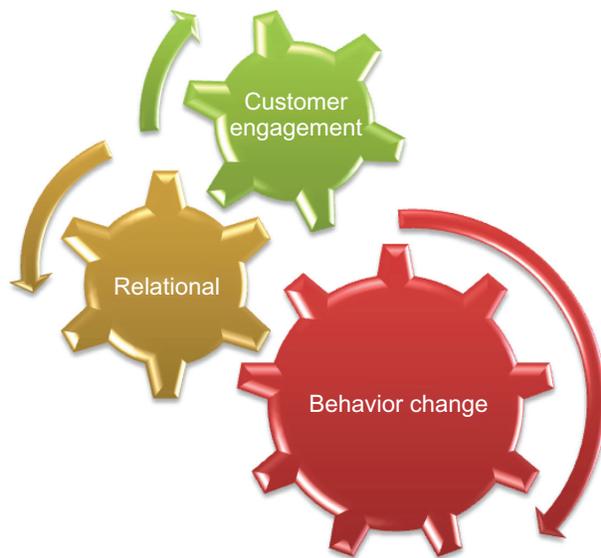

Figure 3 Customer engagement in social marketing.

the underlying mechanisms by which customer loyalty forms for new customers of a service brand as well as the mechanisms by which loyalty may be maintained for repeat purchase customers of a service brand”.⁸¹

Current research focuses on customer engagement behavior which also encompasses customer cocreation.⁹⁰ Trust, commitment, and satisfaction are customer attitudes, which are also motivational drivers for consumers to focus on beyond purchase and consumption. Therefore, customer engagement is seen from a behavioral perspective. Customer engagement also allows for the expression of a customer’s preferred contextual self.⁸⁵ This addresses the fragmentation between the individual and society in postmodern culture. Andreasen⁴ has discussed the need for the target audience to be involved in predesign, design, implementation, and evaluation of social programs. However, there has been a surprising oversight by social markets in integrating customers theoretically into social marketing programs,

even though reviews of social marketing highlight the importance of focusing on customers for behavior change. Hastings⁵ had made contributions in adding the relational paradigm in social marketing, and Russell-Bennett et al⁷⁹ have discussed a value creation model for governmental social marketing activities. Their paper suggests integrating customer engagement in social marketing, as shown in Figure 3, for further deepening of the social marketing domain.

For customers to perceive value and benefit in social marketing interventions and to establish long-term relationships, there is a need to engage customers in creating value to maintain loyalty. The relationships built with different stakeholders through interactions motivate customers to be involved in the design and implementation of effective social marketing programs. Involvement and interaction allow room for customers to be cocreators in social marketing programs, which customers can then identify with (trust) and commit to (moving from intentions to actual behavior). Social marketing is still the umbrella for behavioral change. Behavioral change is regarded as a subcategory of a larger concept, ie, behavioral influence.¹³ Within effective social marketing programs, there is a need to create perceived value/benefit of behavioral change in the minds of customers. This will only happen if there is an environment of satisfaction, trust, and commitment, which needs customer engagement, ie, involvement and interactions. Trust, commitment, and satisfaction are antecedents to creating positive perceived value/benefit, and are also outcomes of positive perceived value/benefit, which then leads to sustainable behavioral change. The move to relational and engagement paradigms in social marketing does not mean that social marketers should ignore the important role played by the traditional marketing mix in designing effective social marketing programs. Segmentation of the target audience, in this case youth, is also critical, as proposed in Figure 4.

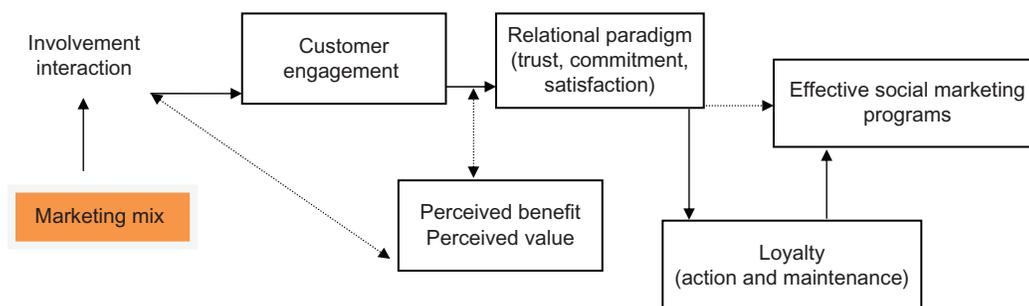

Figure 4 Proposed framework for effective social marketing programs.

Conclusion

Social marketing as a domain started when Wiebe⁹ questioned “why brotherhood can’t be sold like soap?” The social marketing domain has been dominated by interventions and objectives concerning behavioral change,⁵ mostly concentrating on the marketing mix. One oversight by many social marketers has been that when Wiebe posed the above question, the focus shifted towards “soap”, ie, commercial marketing, instead of broadening the focus to include the “brotherhood” aspects in social marketing. The Oxford Dictionary⁸⁹ defines brotherhood as “the feeling of kinship with and closeness to a group of people or all people who are linked with a common interest or association”. This social network is evident amongst youth, who see groups as a reflection of their identity.

The premise of social marketing is not only based on adapting commercial marketing techniques but also on relationships. There are sets of values and perceptions in the contemporary world to create positive perceived value in the minds of youth through meaningful and long-term relationships (trust, commitment, and satisfaction), and youth need to be engaged right at the beginning (through involvement and interactions) for sustainable behavioral change. Trust, commitment, and satisfaction are not only consequences of customer engagement but are also antecedents of customer engagement in the long term. The absence of customer engagement undermines social marketing programs which have their foundations in youth. If behavioral change is the ultimate goal, then the process of building relationships has to be incorporated into social marketing. To build this relationship, youth in social marketing programs should be seen as customers and partners in cocreating value. This allows for both consumer-oriented and stakeholder-oriented outcomes to be achieved. Customer engagement should be seen as an added dimension in effective social marketing programs.

Perceived value and perceived benefit of individuals is a manifestation of self image. Because the postmodern customer is going through a transformation of value systems, there is a greater need for empowerment and capacity building. Empowerment refers to the ability of people to gain understanding and control over personal, social, economic, and political forces in order to take action to improve their life situations.⁹⁰ With empowerment, one can bridge the gap between society and the individual. The process of empowerment, dialog, interaction, and involvement is difficult,⁵ but it can be achieved by engaging customers throughout planning, design, implementation, and evaluation of social marketing programs, especially with the involvement of social media.

This paper attempts to provide a perspective for integrating customer engagement into a social marketing program. Future research can focus on testing the framework empirically and deepening this concept in social marketing.

Adolescent Health, Medicine and Therapeutics

Dovepress

Publish your work in this journal

Adolescent Health, Medicine and Therapeutics is an international, peer-reviewed, open access journal focusing on health, pathology, and treatment issues specific to the adolescent age group. All aspects of health maintenance, preventative measures and disease treatment interventions are addressed within the journal and practitioners from

all disciplines are invited to submit their work as well as healthcare researchers and patient support groups. The manuscript management system is completely online and includes a very quick and fair peer-review system. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
