CORRIGENDUM

Circulating Serum Exosomal aHIF Is A Novel Prognostic Predictor For Epithelial Ovarian Cancer [Corrigendum]

Tang X, Liu S, Liu Y, et al. *Onco Targets Ther.* 2019;12:7699–7711.

Upon reviewing the article, the authors noticed an error in Figure 1A (page 7703). The authors had mixed up and uploaded the incorrect figure panel. The authors apologize for this error. The authors confirm that the revised figure does not affect the results and conclusion of the article. The corrected version of Figure 1A is as follows:

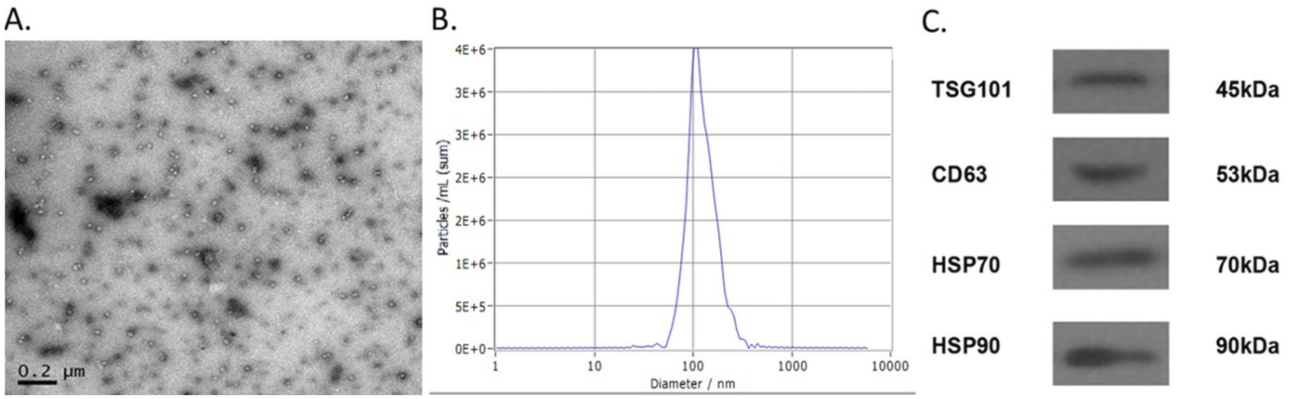

Figure 1 Characterization of exosomes derived from serum. TEM showed exosomes derived from serum had round-shaped morphology ranged from 30 nm to 100 nm (**A**, scale bar =200 nm). Size distribution of exosomes through NTA revealed that average size of exosomes was 100 nm (**B**). Western blotting for CD63, TSG101, Hsp-70, Hsp-90 as exosomal markers (**C**).

Abbreviations: TEM, transmission electron microscopy; NTA, nanoparticle tracking analysis.
